Arithmetic

Definition

$$x = \pm \left(d_0 + rac{d_1}{eta^1} + rac{d_2}{eta^2} + \ldots + rac{d_{p-1}}{eta^{p-1}}
ight)eta^E$$

$$\beta$$
: base

$$p$$
: precision

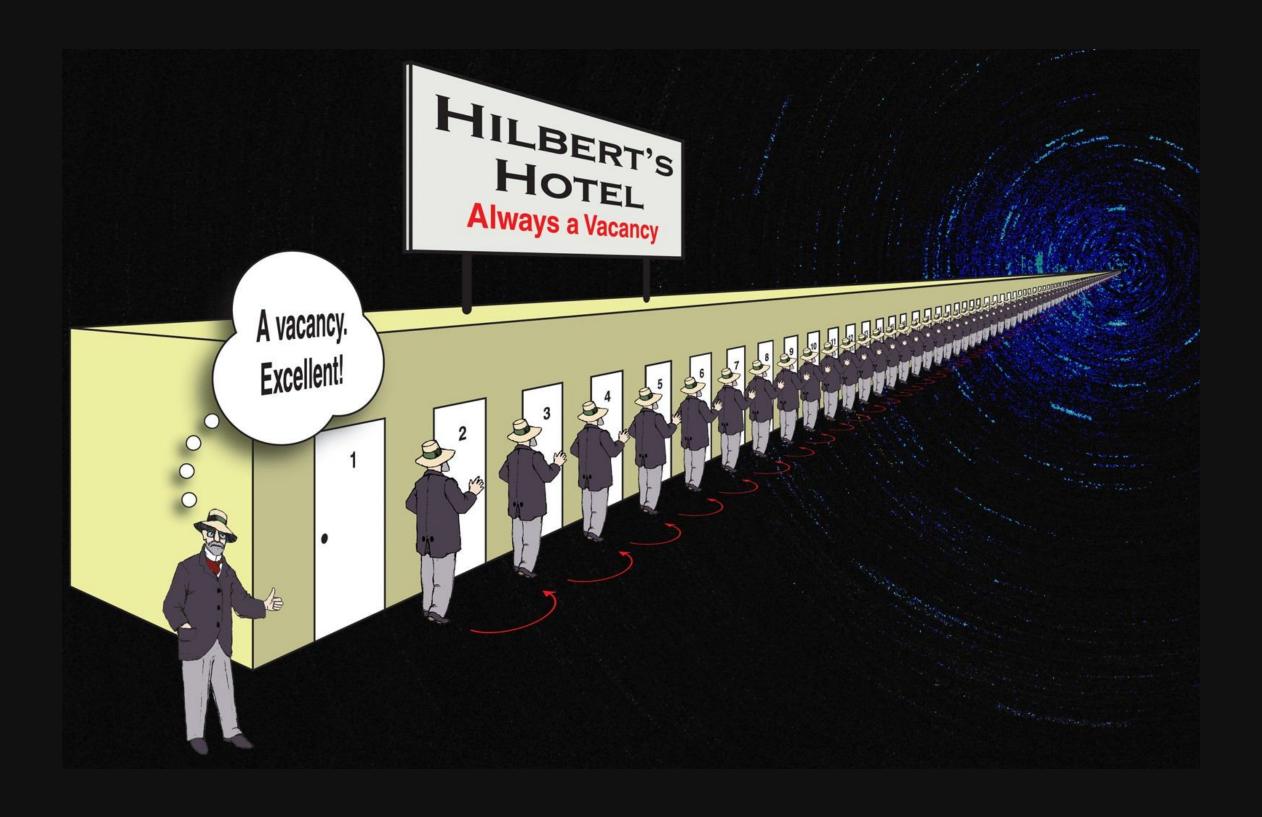

$$[L,U]$$
 : exponent range

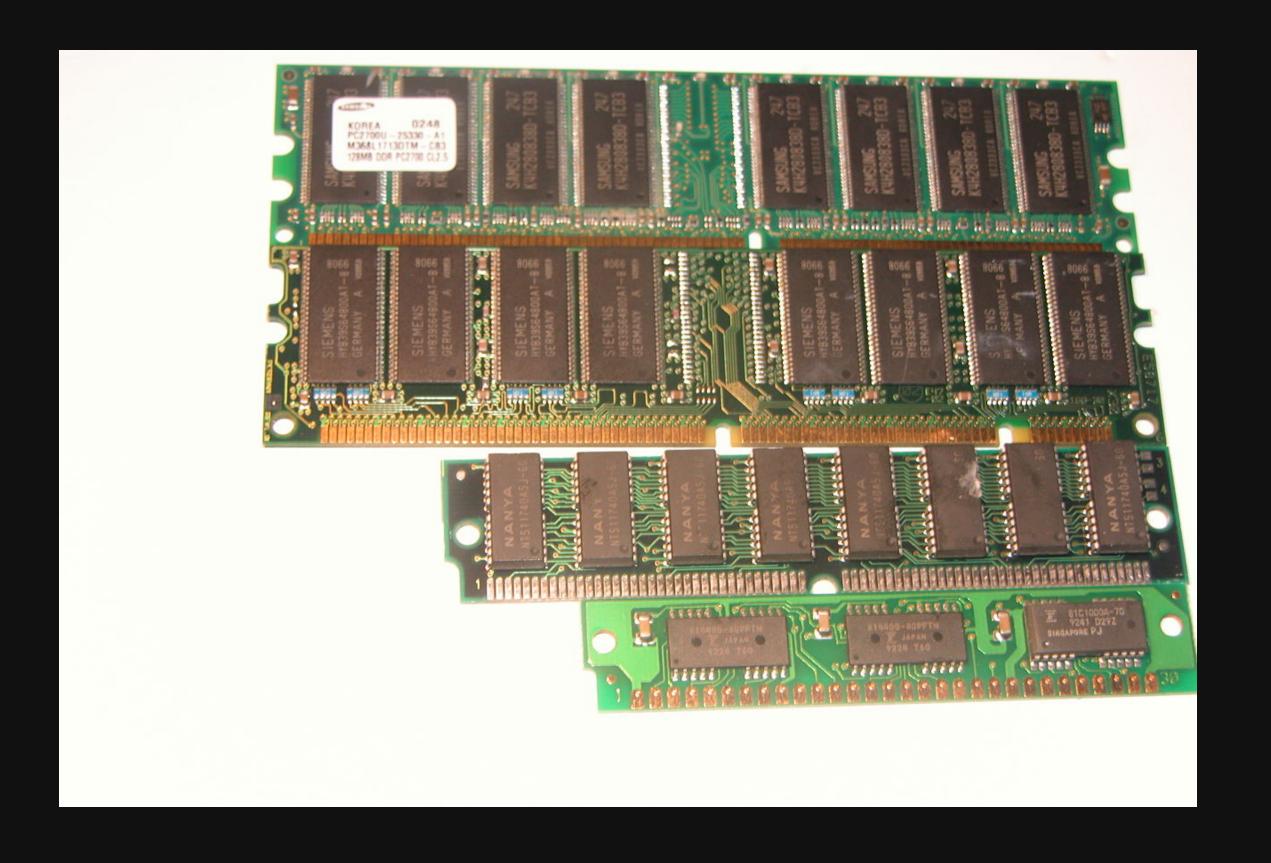

$$0 \leq d_i \leq \beta-1$$

$$i=0,\ldots,p-1$$

$$E \in [L,U]$$

finite and discrete

```
let x=1/n,\ n\in\mathbb{Z}, show (n+1)x-1=x
 for n in range(1, 11):
   x = 1/n
   xin = x
   for k in range (30):
    x = (n + 1)*x - 1
   print(n,xin,x)
 1 1.0 1.0
 2 0.5 0.5
 3 0.333333333333333 -21.0
 4 0.25 0.25
 5 0.2 6545103.021815777
 7 0.14285714285714285 -9817068105.0
 8 0.125 0.125
 9 0.111111111111111 4934324553889.695
```

10 0.1 140892568471739.25

$$\left(d_0 + rac{d_1}{eta^1} + rac{d_2}{eta^2} + \ldots + rac{d_{p-1}}{eta^{p-1}}
ight)eta^E$$

$$\in [\beta^E,\beta^{(E+1)}]$$

relative error

$$\in \left[rac{(eta/2)eta^{-p}eta^E}{eta^{(E+1)}}, rac{(eta/2)eta^{-p}eta^E}{eta^E}
ight]$$

$$\in [(1/2)eta^{-p},(eta/2)eta^{-p}]$$

therefore

$$\epsilon_{mach}=eta^{1-p}/2$$

$$\mathtt{fl}(x \mathtt{op} y) = (x \mathtt{op} y)(1 + \delta)$$

where
$$|\delta| \leq \epsilon_{mach}$$
 ,

f1 denotes floating representation andop denotes any elementary arithmetic operations,+, -, x and /.

Example

$$egin{aligned} extbf{fl}(x(y+z)) &= extbf{fl}((x+(y+z)(1+\delta_1))(1+\delta_2)) \ &= x(y+z)(1+\delta_1+\delta_2+\delta_1\delta_2) \ &pprox x(y+z)(1+\delta_1+\delta_2) \ &\leq x(y+z)(2\epsilon_{mach}) \end{aligned}$$

Catastrophic Cancellation

```
import math
def funexp(x,order) :
    ex = 1
    for i in range(1 , order + 1):
        ex = ex + math.pow(x,i)/math.factorial(i)
    return (ex)
ex = funexp(-4,10)
print(ex)
print(math.pow(math.e,-4))

0.09671957671957698
0.018315638888734186
```

Computing Residuals

Suppose we obtained the solution \hat{x} for a linear system ax=b. We are to compute the residual $r=b-a\hat{x}$

$$egin{aligned} \mathtt{fl}(a\hat{x}) &= a\hat{x}(1+\delta_1) \ \mathtt{fl}(b-a\hat{x}) &= (b-a\hat{x})(1+\delta_1)(1+\delta_2) \ &= (r-a\hat{x}\delta_1)(1+\delta_2) \ &= r(1+\delta_2) - a\hat{x}\delta_1 - a\hat{x}\delta_1\delta_2 \ &pprox r(1+\delta_2) - b\delta_1 \end{aligned}$$

Conditioning

Question

well-posed, if its solution

- exists
- unique
- depends continuously on the data

Question

algorithm: stable

solution: well-conditioned

Errors

$$\begin{aligned} \text{total errors} &= \hat{f}\left(\hat{x}\right) - f(x) \\ &= (\hat{f}\left(\hat{x}\right) - f(\hat{x})) + (f(\hat{x}) - f(x)) \\ &= \text{computation error} + \text{data error} \end{aligned}$$

Errors

forward error : $\Delta y = \hat{y} - y$

backward error : $\Delta x = \hat{x} - x$, where $f(\hat{x}) = \hat{y}$

Errors

Example:

$$cos(x) = 1 - rac{x^2}{2} + rac{x^4}{4!} - rac{x^6}{6!} \dots$$

$$\hat{y}=\hat{f}\left(x
ight)=1-rac{x^{2}}{2}$$

for x=1 , we have

$$\left.egin{aligned} y &= f(1) pprox 0.5403 \ \hat{y} &= \hat{f}\left(1
ight) = 0.5 \end{aligned}
ight\} \Rightarrow \Delta y = \hat{y} - y = -0.0403 \ \Delta x = \hat{x} - x = rccos(\hat{y}) - x = 0.0472 \end{aligned}$$

Condition number

a measure on the effects on the solution incurred by data perturbation

$$\left| rac{\Delta y/y}{\Delta x/x}
ight| pprox \left| rac{xf'(x)}{f(x)}
ight|$$

Condition number

Question:

what is the condition number for the inverse function?

$$g(y) = f^{-1}(y)$$

$$\boldsymbol{A}\boldsymbol{x}=\boldsymbol{b}$$

$$\operatorname{cond}(\boldsymbol{A}) = ||\boldsymbol{A}|| ||\boldsymbol{A}||^{-1}$$

induced matrix norm

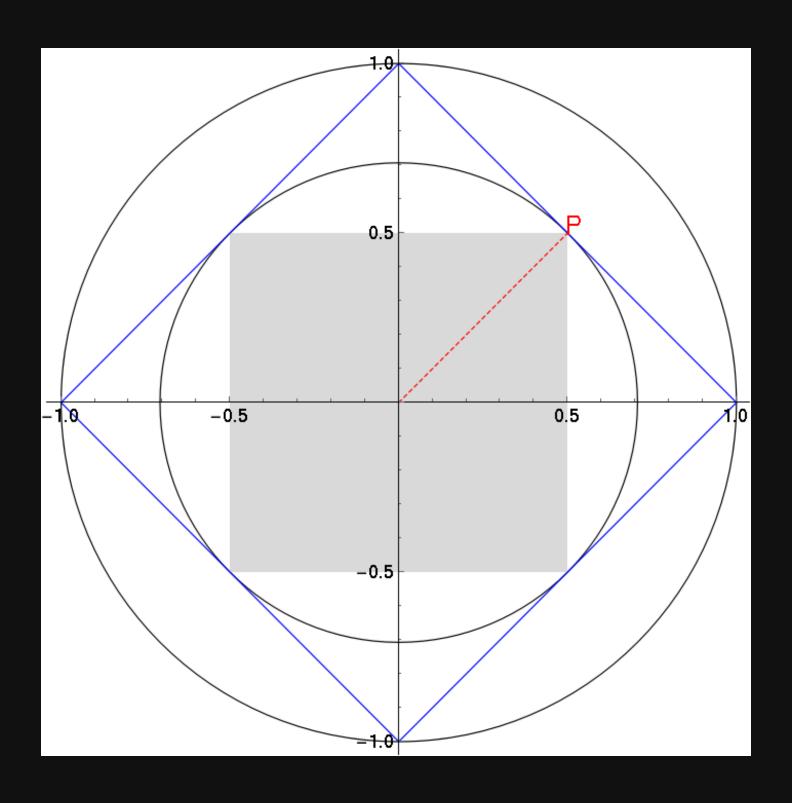

$$\|oldsymbol{A}\| = \max_{oldsymbol{x}
eq oldsymbol{0}} rac{\|oldsymbol{A}oldsymbol{x}\|}{\|oldsymbol{x}\|}$$

vector norms

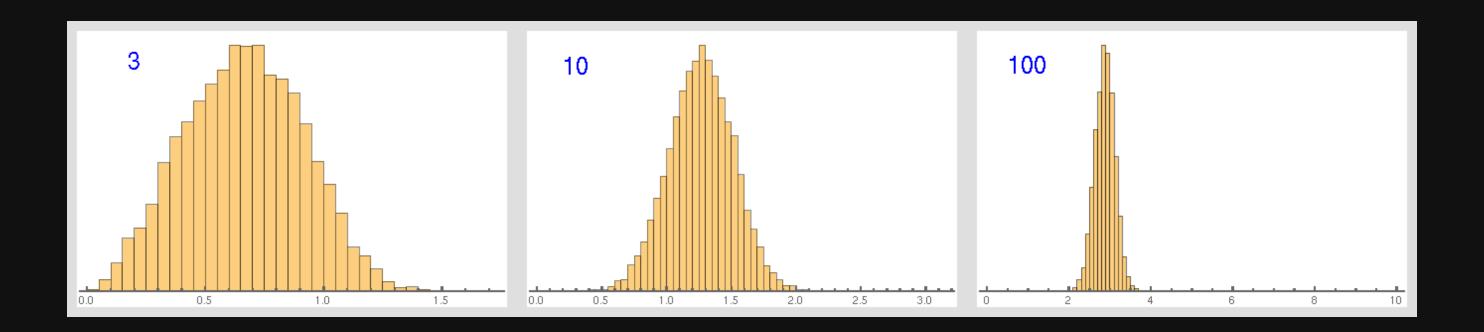

$$\|oldsymbol{x}\|_1 = \sum_i^n |x_i|$$

$$\|oldsymbol{x}\|_2 = \left(\sum_i^n x_i^2
ight)^{1/2}$$

$$\|oldsymbol{x}\|_{\infty} = \max_{1 \leq i \leq n} |x_i|$$

Euclidean distance between two random points

linear system : $m{A}m{x} = m{b}$

residual :
$$m{r} = m{b} - m{A} m{\hat{x}}$$

$$egin{aligned} \|\Delta x\| &= \parallel \hat{oldsymbol{x}} - oldsymbol{x} \| \ &= \parallel oldsymbol{A}^{-1} (oldsymbol{A} \hat{oldsymbol{x}} - oldsymbol{b}) \| \ &= \parallel oldsymbol{A}^{-1} oldsymbol{r} \| \ &\leq \parallel oldsymbol{A}^{-1} \parallel \parallel oldsymbol{r} \| \end{aligned}$$

$$rac{\|oldsymbol{\Delta}oldsymbol{x}\|}{\|oldsymbol{x}\|} \leq \operatorname{cond}(oldsymbol{A}) rac{\|oldsymbol{r}\|}{\|oldsymbol{A}\|\|\hat{oldsymbol{x}}\|}$$

 $m{Ax} \simeq m{b}$

Normal equation

$$egin{aligned} \phi(oldsymbol{x}) &= (oldsymbol{b} - oldsymbol{A}oldsymbol{x})^T (oldsymbol{b} - oldsymbol{A}oldsymbol{x}) \ &= oldsymbol{b}^Toldsymbol{b} - 2oldsymbol{x}^Toldsymbol{A}oldsymbol{b} + oldsymbol{x}^Toldsymbol{A}oldsymbol{x} \end{aligned}$$

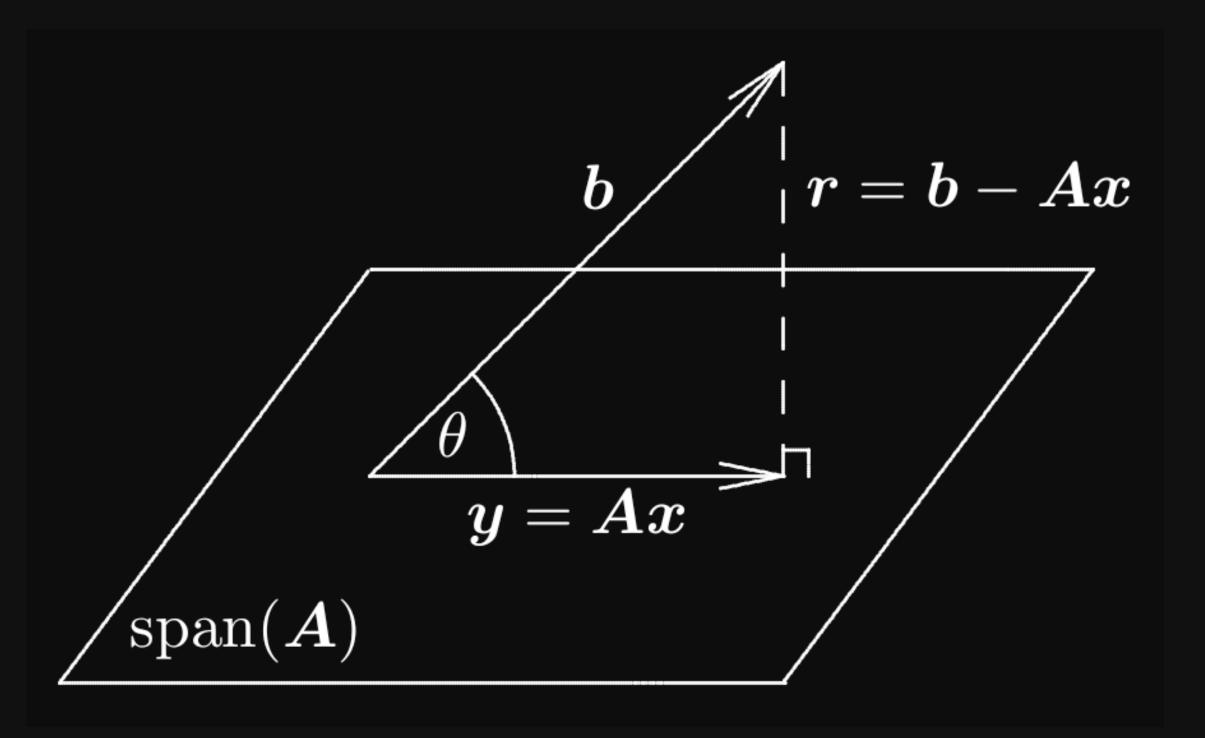

$$oldsymbol{0} =
abla \phi(oldsymbol{x}) = 2oldsymbol{A}^Toldsymbol{A}oldsymbol{x} - 2oldsymbol{A}oldsymbol{b}$$

$$\boldsymbol{A}^T \boldsymbol{A} \boldsymbol{x} = \boldsymbol{A} \boldsymbol{b}$$

Geometrical interpretation

$$oldsymbol{y} = oldsymbol{A}oldsymbol{x} \in \operatorname{span}(oldsymbol{A})$$

orthogonal projection $oldsymbol{b}$ onto the ${\sf span}(A)$

Projector matrix: idempotent

$$oldsymbol{P}^2 = oldsymbol{P}$$

Orthogonal projector:

$$oldsymbol{P}^T = oldsymbol{P}$$

$$oldsymbol{P}_{\perp} = oldsymbol{I} - oldsymbol{P}_{\parallel}$$

$$oldsymbol{v} = (oldsymbol{P} + (oldsymbol{I} - oldsymbol{P}) oldsymbol{v}) = oldsymbol{P} oldsymbol{v} + oldsymbol{P}_{\perp} oldsymbol{v}$$

$$egin{aligned} \|oldsymbol{b} - oldsymbol{A}oldsymbol{x}\| &= \|oldsymbol{P}(oldsymbol{b} - oldsymbol{A}oldsymbol{x}) + oldsymbol{P}oldsymbol{b} - oldsymbol{A}oldsymbol{x})\|^2 \ &= \|oldsymbol{P}oldsymbol{b} - oldsymbol{A}oldsymbol{x}\|^2 + \|oldsymbol{P}oldsymbol{b}\|^2 \ &= \|oldsymbol{P}oldsymbol{b} - oldsymbol{A}oldsymbol{x}\|^2 + \|oldsymbol{P}oldsymbol{b}\|^2 \ &= \|oldsymbol{A}oldsymbol{x} - oldsymbol{A}oldsymbol{x}\|^2 + \|oldsymbol{P}oldsymbol{b}\|^2 \end{aligned}$$

$$oldsymbol{A}^Toldsymbol{P} = oldsymbol{A}^Toldsymbol{P}^T = (oldsymbol{P}oldsymbol{A})^T = oldsymbol{A}^Toldsymbol{A}oldsymbol{x} = oldsymbol{A}^Toldsymbol{A}oldsymbol{x} = oldsymbol{A}^Toldsymbol{A}oldsymbol{x} = oldsymbol{A}^Toldsymbol{A}oldsymbol{x}$$

Question:

Can you show $oldsymbol{P}$ is indeed a projection matrix?

Can $oldsymbol{P}$ be an identity matrix?

pseudo inverse :
$$oldsymbol{A}^+ = (oldsymbol{A}^T oldsymbol{A})^{-1} oldsymbol{A}^T$$

$$\operatorname{cond}(\boldsymbol{A}) = \parallel \boldsymbol{A} \parallel_2 \parallel \boldsymbol{A}^+ \parallel_2$$

perturbation : $oldsymbol{b} + \Delta oldsymbol{b}$

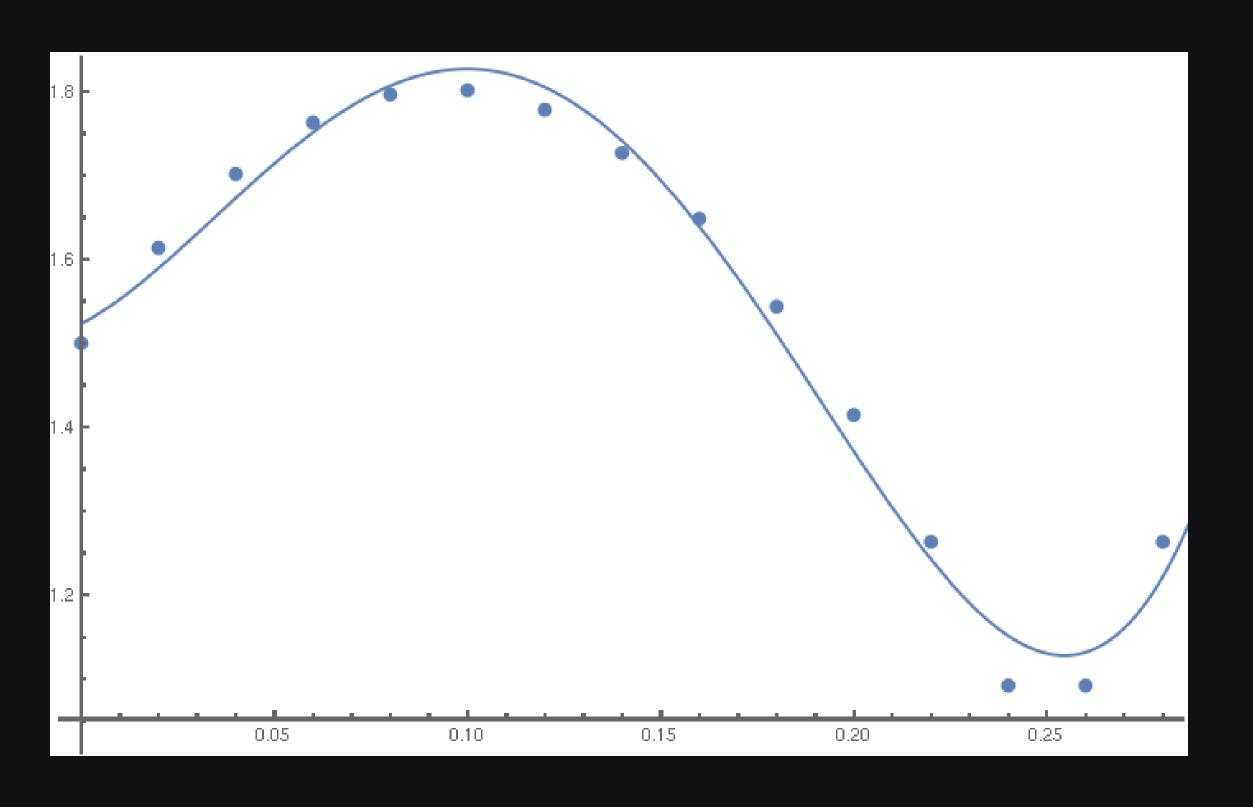

$$egin{aligned} m{A}^Tm{A}\Deltam{x} &= m{A}^Tm{b} \ \Deltam{x} &= (m{A}^Tm{A})^{-1}m{A}^T\Deltam{b} &= m{A}^+\Deltam{b} \ \|\Deltam{x}\|_2 &\leq \|m{A}^+\|_2 + \|\Deltam{b}\|_2 \ rac{\|\Deltam{b}\|_2}{\|m{x}\|_2} &\leq \|m{A}^+\|_2 + rac{\|\Deltam{b}\|_2}{\|m{x}\|_2} \ &= \mathrm{cond}(m{A}) rac{\|m{b}\|_2}{\|m{A}\|_2 \|m{x}\|_2} rac{\|\Deltam{b}\|_2}{\|m{b}\|_2} \ &\leq \mathrm{cond}(m{A}) rac{\|m{b}\|_2}{\|m{A}m{x}\|_2} rac{\|\Deltam{b}\|_2}{\|m{b}\|_2} \ &= \mathrm{cond}(m{A}) rac{1}{cos(heta)} rac{\|\Deltam{b}\|_2}{\|m{b}\|_2} \end{aligned}$$
